| Course code: CIE504 | New Damietta |  |

- Answer all the questions.
- Net sketch drawings are required.
- Any missing data can be reasonably assumed.

Question (1): (13 Marks) (c2-a2, cl1-a2, c13-c1)
For the Counterfort wall shown in the figure,

## Check the overall stability of the wall and design $\underline{\mathbf{S}_{1} \text { and } S_{2} \text { slabs (Calculate area steel only). }}$

(spacing of counterfort $=\mathbf{3 m}$ ), $\mathrm{F}_{\text {all }}$ for the soil $14 \mathrm{t} / \mathrm{m}^{2}, \Phi=30^{\circ}$ L.L 0.9t $/ \mathrm{m}^{2}, \quad \gamma=1.8 \mathrm{t} / \mathrm{m}^{3}$

Question (2): (17 Marks) (c2-a2, cl1-a2, cl3-c1)
a- State different uses of weir structures and their main types (use sketches).
b- A R.C. Bridge (Slab with main girder type) consists of two vents is supposed to be constructed at the site of intersection between main road and a channel. The following data are available: The width of one vent is $\mathbf{7 . 5 \mathbf { ~ m }}$ and the width of the pier is $\mathbf{1 . 5 m}$

- Data for the Roadway:- Roadway width $=8.00 \mathrm{~m}-$ Bank level $=(10.00)-$ Side slope $=2: 1-$ Berm level $=(8.00)$
- Data for the Channel:- Bed level $=(4.00)$ - Berm level $=(8.00)$ - Bank level $=(10.00)$ - Bed width $=16.5 \mathrm{~m}$ - Side slopes are $1: 1 \& 2: 1$
-Data for the Bridge:- Bridge width (excluding sidewalks) $=\mathbf{8 . 0 0} \mathbf{~ m}$ - Sidewalk width $=\mathbf{2 . 0 0} \mathbf{~ m}$-Spacing between Girders $=\mathbf{2 . 0 0} \mathbf{m}$-- Concentrated live load $=\mathbf{2 0}$-ton lorry - Pedestrian live load $=\mathbf{5 0 0}$ $\mathbf{K g} / \mathbf{m}^{2}$ -

## It is required to:

1. Design the R.C. slab of this bridge.
2. Design the sidewalk of the bridge.
3. Calculate the values of moment and shear for the main girder

Question (3): (22 Marks) (c2-a2, c11-a2, c13-c1)
I - A R.C. 2 vents culvert is to be constructed to pass the flow of a canal under a highway. The available data for the design are:

Canal date: - Bed width $=4.0 \mathrm{~m}$, - Bed level $=(10.00) \mathrm{m}$, - Water level $=(11.90) \mathrm{m}-$ Berm level $=(12.50)-$ Berm width $=5.00 \mathrm{~m}-$ Bank level $=(14.00) \mathrm{m}-$ Bank width $=10.0 \mathrm{~m}$, - Inner side slope $=$ $2: 1$, - Outer side slope $=2: 1$.
$\underline{\text { Road data: }}$ - Side slope of road $=2: 1,-$ Road width $=10.0 \mathrm{~m},-$ Land level $=(14.50) \mathrm{m}$.
Max. canal discharge $=9 \mathrm{~m}^{3} / \mathrm{s}$, Inlet and outlet wing walls are box type, Screen angle $=60^{\circ}$, Bars diameter $=2.5 \mathrm{~cm}$ and distance between bars $=30 \mathrm{~cm}$.

If the heading up not exceeds 20 cm , the moving load is supposed to be $3.0 \mathrm{t} / \mathrm{m}^{2}$ and $\gamma_{\text {bulk }}$ for soil $=1.7 \mathrm{t} / \mathrm{m}^{3}$, it is required to:
1 - Calculate the actual velocity through the Culvert and the actual Heading up.
2 - Calculate the total vertical and horizontal loads on the culvert cross section.
(7 Marks)

II - It is required to construct a steel pipe syphon at the crossing of canal and drain according the following data:

|  | Bed <br> level | H.W.L. | Berm <br> level | Bank <br> level | Bed <br> width | Bank <br> width | Inner <br> slope | Outer <br> slope |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Canal | $(11.50)$ | $(13.90)$ | $(14.50)$ | $(16.00)$ | 12.0 | 10.0 | $3: 2$ | $3: 2$ |
| Drain | $(10.00)$ | $(11.65)$ | $(14.00)$ | $(15.00)$ | 7.0 | 8.0 | $3: 2$ | $3: 2$ |

Max. drain discharge $=7.8 \mathrm{~m}^{3} / \mathrm{s}$, Inlet and outlet wing walls are box type, Screen angle $=60^{\circ}$, Bars diameter $=2.5 \mathrm{~cm}$ and distance between bars $=30 \mathrm{~cm}$.

If the No. of vents is 3 , the diameter of the pipe is 1.5 m and the heading up not exceed 20 cm , it is required to:
1 - Specify if the syphon will be straight or bending, also is the type of walls at inlet and exit will be box type or broken?
(4 Marks)
2 - Calculate the actual velocity through the syphon and the actual Heading up.
(4 Marks)
3 - Calculate the thickness of the pipe and then check the stress for the internal pressure force only.
(3 Marks)
Question (4): ( 8 Marks) (c2-a2, c11-a2, c13-cl)
1 - Explain briefly with neat sketches, how to operate the lock?
(2 Marks)
2 - What is the type of failures of dams? discuss briefly the environmental impacts of dams. (2 Marks)
3 - The table below gives the inflow hydrograph for a river with max. reservoir storage $=1200 \mathrm{Mll} \mathrm{m}^{3}$. The water demand is $600 \mathrm{Mll} \mathrm{m}^{3} / \mathrm{year}$. It is required to determine the total volume of water that will be spilled out over the given years.
(4 Marks)
